

82 - RMIG - Perforated Metals for Architecture

Creativity, Control & Capability

RMIG is the world's largest manufacturer and supplier of perforated metal, which is used in a wide range of decorative and functional applications in architecture, construction and other industry sectors.

With 15 offices including 7 manufacturing units located throughout Europe and more than 100 years of experience in providing perforated solutions, RMIG has a wealth of tooling, engineering and technical expertise that has already been used by countless architects to provide eye-catching, innovative and often unique building solutions.

Complete Solution

Combining materials technology, with advanced manufacturing and a virtually limitless palette of perforations and forming options, enables RMIG to provide perfectly engineered solutions to meet a precise brief or specification. In many cladding, façade and balustrade projects, we also provide expert insight to help the designer or artist arrive at a solution from nothing more than an inspirational idea.

To further reinforce the ability to deliver robust, aesthetic and well-engineered solutions, RMIG's manufacturing capabilities extend well beyond perforating to provide a comprehensive fabrication service including bolt holes punching, bending, forming and laser profile cutting all to a high degree of precision.

Whether the material selected is stainless steel to enhance anti-corrosion performance and visual appeal, the flexibility of lightweight aluminium or even titanium to provide high strength with low mass – RMIG can provide it.

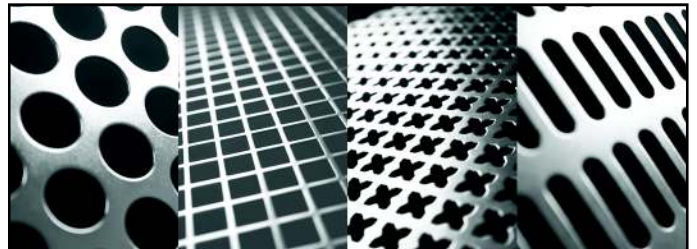

Alternatively, if material choice is part of the overall project and guidance is required, then RMIG can discuss the design concepts and specifications and develop suitable recommendations to meet these specific needs. The choice of finish can also be dependent on the material chosen, whether it's natural, galvanised, polyester powder coated or anodised, as creating the perfect finish is also part of the service.

Technical Support - The Perfect Finish

RMIG's role is to assist architects and specifiers convert their ideas into the ideal solution, whether it's developed from one of our thousands of existing perforation, embossing and forming patterns or created specifically to meet a unique set of criteria using bespoke tooling to create dramatic visual effects.

Highly advanced tooling and specialist presses make concept to reality a quick and easy journey. As RMIG handles the entire process, quality control and high standards of manufacture are already 'built-in' to ensure there is no need to source additional contractors for forming or finishing. This not only saves time, but also removes unnecessary costs, such as additional transportation.

Whatever the requirements, RMIG can deliver the perfect solution and is ideally equipped to meet any technical challenges that may be present to ensure the end result not only meets the design brief, but also the aesthetic and functional demands of the project and the structure.
